

IN THE CLAIMS:

Please amend the claims as follows:

1. (Currently Amended) A method of filtering a bitstream **havingcomprising** elementary units having a time position, and first timing data indicative of said time positions, ~~said method using:~~ a syntactical description of said bitstream, said syntactical description **havingcomprising** elements describing said elementary units and containing said first timing data, a semantic description of said bitstream, said semantic description comprising second timing data and characterizing data relating to one or more elementary units, said second timing data being indicative of the time positions of said elementary units, at least a user specification, said method comprising the steps of:

by a filtering processor,

searching in said semantic description for the characterizing data that match said user specification to identify matching elementary units,

deriving time positions for said matching elementary units from said second timing data,

using said first timing data to locate in said syntactical description the elements corresponding to said time positions,

generating a filtered syntactical description in which the located elements are removed,

generating a filtered bitstream from said filtered syntactical description.

2. (Currently Amended) ~~The~~**A** filtering method as claimed in claim 1, wherein said syntactical description is an XML document and said filtered syntactical description is generated by applying to said syntactical description a parametric transformation defined in an XSL style sheet having said time positions as input parameter.

3. (Currently Amended) ~~The~~A filtering method as claimed in claim 1, wherein said semantic description is compliant with the MPEG-7 standard, and said second timing data are contained in <MediaTime> elements.

4. (Currently Amended) A device for filtering a bitstream comprising: elementary units having a time position, and first timing data indicative of said time positions, ~~using:~~ a syntactical description of said bitstream, said syntactical description ~~having~~comprising elements describing said elementary units and containing said first timing data, a semantic description of said bitstream, said semantic description ~~having~~comprising second timing data and characterizing data relating to one or more elementary units, said second timing data being indicative of the time positions of said elementary units, at least a user specification, ~~said device comprising, means for:~~a filtering processor, said filtering processor configured for

- searching in said semantic description for the characterizing data that match said user specification to identify matching elementary units,

- deriving time positions for said matching elementary units from said second timing data,

- using said first timing data to locate in said syntactical description the elements corresponding to said time positions,

- generating a filtered syntactical description in which the located elements are removed,

- generating a filtered bitstream from said filtered syntactical description.

5. (Currently Amended) A transmission system comprising:

- a server device,

- a transmission channel,

- and a user device, said user device being intended to receive, from said server device via said transmission channel, a bitstream comprising elementary units having a time position and first timing data indicative of said time positions, and a semantic description of said bitstream, said semantic description comprising second timing data and characterizing data relating to one or more elementary units, said second timing data

being indicative of the time positions of said elementary units, said user device **having a processor comprising means for:**

capturing at least a user specification,

generating a syntactical description of said bitstream, said syntactical description comprising elements describing said elementary units and containing said first timing data,

searching in said semantic description for the characterizing data that match said user specification to identify matching elementary units,

deriving time positions for said matching elementary units from said second timing data,

using said first timing data to locate in said syntactical description the elements corresponding to said time positions,

generating a filtered syntactical description in which the located elements are removed,

generating a filtered bitstream from said filtered syntactical description.

6. (Currently Amended) A transmission system comprising:

a server device,

a transmission channel,

~~and~~ a user device, said user device having means for sending a demand for a content to said server device via said transmission channel, said demand including a user specification, and said server device **having a processor means** for filtering a bitstream corresponding to the demanded content according to said user specification and for sending the filtered bitstream to said user device via said transmission channel,

wherein said bitstream **includes—**~~comprises~~ elementary units having a time position and first timing data indicative of said time positions, is semantically described in a semantic description comprising second timing data and characterizing data relating to one or more elementary units, said second timing data being indicative of the time positions of said elementary units, is syntactically described in a syntactical description comprising elements describing said elementary units and containing said first timing data, and,

said **processor** means for filtering the bitstream that correspond to the demanded content **is configured** ~~comprise~~ means for: searching in said semantic description for the characterizing data that match said user specification to identify matching elementary units, deriving time positions for said matching elementary units from said second timing data, using said first timing data to locate in said syntactical description the elements corresponding to said time positions, generating a filtered syntactical description in which the located elements are removed, generating a filtered bitstream from said filtered syntactical description.

7. Cancelled.

8. Cancelled.
